

Figure S5. Relative cell count identified for each cell type by tissue. A total of 66 cell types were identified across all 24 libraries or 20 tissues. Relative cell count was calculated as the quotient of the counts per cell type in a tissue and the total cell count of a tissue. For samples, which had both single cell and single nuclei libraries, the total cell count of a tissue was computed through first adding the total cell count in a sample together.
